# Micron MT01b Transmit Module (from v1.3)

PLACEHOLDER FOR V1.3

MT01b is a radio module which can be used to make a 7 channel DSM2 2.4GHz transmitter. It is compatible with all Micron and Deltang receivers and the range is suitable for indoor and small outdoor sites.

THIS DOCUMENT IS INCOMPLETE. The current firmware functionality mirrors the Deltang Tx2 for profiles 1, 5, 6 and 7. Please contact Micron if you have any quiestions about usage.
Connections

The module has 3 JST-SH connectors: a 10 pin for inputs, GND/0V and 3.3V regulated supply for analogue controls; a 6 pin for battery input and indicator LED; and a 3 pin for future serial input. All connectors have unused pins which are for future enhancements.

10 pin JST-SH input connector

aerial connector, or wire aerial mounting

Profile — short these pins to set the profile

LED

MT01b does not have an on-board LED. You will need to connect JST-SH 6p, pin 3 to an external LED - see one of the wiring diagrams below for an example LED connection.

6 pin power connector

The only usable pins with the current firmware release are 3, 5 & 6 (LED, 0V, Vin). Pin 6 should be connected to the battery via an on/off switch; there is a diode on the MT01b board to protect against reverse polarity. P9, P10 and Cal will be supported in a future firmware release.

P9	1. White
P10	2. Blue
LED	3. Green
Cal	4. Yellow
0V	5. Black
Vin	6. Red

10 pin signal connector

Pins 1 to 7 are the control inputs, either analogue or digital depending on the selected profile. The max analogue input voltage for full control range is 1.65V. Any unused analogue inputs should be connected to negative to avoid input noise affecting adjacent analogue channels.

Pin 8 is not used by the current firmware release. Pin 9 provides a regulated 3.3V output for use with analogue controls; a voltage divider should be used so that the analogue input voltage varies between 0V and 1.65V - i.e. a 10k ohm potentiometer should have a 10k ohm resistor in series.

P1	━━━━━━	1. Red
P2	━━━━━━	2. Black
P3	━━━━━━	3. Yellow
P4	━━━━━━	4. Green
P5	━━━━━━	5. Blue
P6	▭	6. White
P7	━━━━━━	7. Orange
P8	━━━━━━	8. Brown
3.3V	━━━━━━	9. Grey
0V	━━━━━━	10. Purple

Profiles

MT01b profiles provide a collection of input types and are modelled on the Deltang Tx2. The current firmware version implementation supports only profiles 1, 5, 6 and 7; the other Deltang profiles will be added in a future firmware release.

Profile selection is made by:

- short the 'Profile' pads, e.g. with needle nose tweezers
- apply power to MT01b (JST-SH6p, pins 5 and 6)
- the LED will flash the current profile twice
- while the short is in place, the LED will scroll through the profile options (1, 5, 6)
- remove the short to select a profile
- switch off when the LED stays on

Tx20 Circuit

Tx20 is a model train controller and requires profile 5.
